

BITS Assignment part 2 sem 2 2020

Jessani:

User Testing - Design

Mini Quiz - How to Take a Quiz Questions

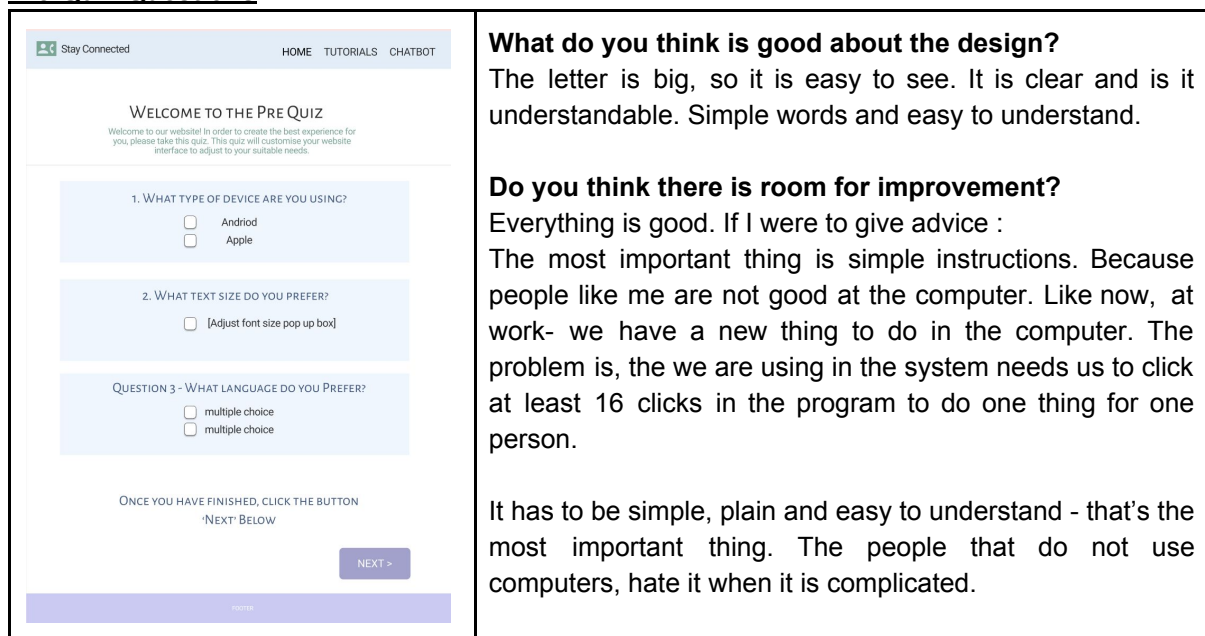

Draft was used to show and to use as assistance when explaining the images ; gif images.

Second image is the final design.

What do you like and dislike about this design? (Mini tutorial on how to use a quiz)

Yes, its good. short sentences, I understand it easily and it's easy to read.

Pre-Quiz Questions

What do you think is good about the design?

The letter is big, so it is easy to see. It is clear and is it understandable. Simple words and easy to understand.

Do you think there is room for improvement?

Everything is good. If I were to give advice :

The most important thing is simple instructions. Because people like me are not good at the computer. Like now, at work- we have a new thing to do in the computer. The problem is, the we are using in the system needs us to click at least 16 clicks in the program to do one thing for one person.

It has to be simple, plain and easy to understand - that's the most important thing. The people that do not use computers, hate it when it is complicated.

USER STORY

As a/an	I want to...	so that...
moderator	create a new game by entering a name and an optional description	I can start inviting estimators
moderator	invite estimators by giving them a url where they can access the game	we can start the game
estimator	join a game by entering my name on the page I received the url for	I can participate
moderator	start a round by entering an item in a single multi-line text field	we can estimate it
estimator	see the item we're estimating	I know what I'm giving an estimate for
estimator	see all items we will try to estimate this session	I have a feel for the sizes of the various items
moderator	see all items we try to estimate this session	I can answer questions about the current story such as "does this include "
moderator	select an item to be estimated or re-estimated	the team sees that item and can estimate it

Example:

I've had done some research on finding some examples of user stories. And they seem to be presented in a table format.

Mini Quiz

As a/ an	Action	Result/ outcome
User	<ul style="list-style-type: none"> As the user enters the website for the first time, they will encounter a short introduction. Onwards, they are provided with an option to read a mini tutorial. The mini tutorial has simplistic instructions that teach the user how to use a quiz if they are unaware of how to use a quiz The first thing the user will see when they enter the website is an introduction of Stay Connected. Then they are provided with an option to take a short mini quiz on how to use a quiz. If they are already aware of how to use a quiz, they are provided with a button to skip the quiz. 	<ul style="list-style-type: none"> If the user chooses to read the mini tutorial, they are expected to be prepared for the upcoming page, which is a pre-quiz. If the user chose to skip the mini tutorial, they are then taken to a pre-quiz page.

Pre-Quiz

As a..	Action	Result/ outcome
User / Online quiz taker.	<ul style="list-style-type: none"> When they have clicked 'Next' from the mini tutorial on how to use a quiz, they will be taken to another page called the pre-quiz. Once they have reached this page, instructions will be provided to start the quiz. The user will see a series of few questions that they need to answer. Then they are expected to select one checkbox and dropdown box options for each corresponding question. Otherwise, the user can skip the whole quiz by clicking the provided 'Skip' button. 	<ul style="list-style-type: none"> After clicking the submit button, the website will be customised and changed according to their preferences. This results to a website being created with options suitable preferences to their preferences. If the user chooses to skip the quiz, the website will be assigned to the default website.

(include an option of both for type of devices)

Or for them to choose a default option: one that does not change anything → so that they do not have to take the quiz at all. (make it so it changes things back to normal/ default.

Need to do user testing: what will they do / how will they take the quiz?
